

Voice to Text Solution

A seamless, AI-powered
Voice to Text solution at scale.

What Is Voice to Text?

As the name suggests, a Voice to Text solution uses artificial intelligence (AI) and machine learning to transcribe spoken words into written text automatically. VoxNet's Voice to Text solution currently allows end users to have voicemails automatically transcribed and sent to them via email, SMS, or the VoxNet Mobile App.

Our Voice to Text solution leverages Google's AI and machine learning capabilities to ensure maximum accuracy and quality of transcriptions. English language transcription is now available, and Spanish language transcription is coming soon.

Why Do You Need Voice to Text?

Businesses benefit from a Voice to Text solution because it can substantially boost productivity. Users benefit from VoxNet's Voice to Text solution in a number of ways:

Convenience

Most professionals spend a significant amount of time in meetings or out of the office where it's not convenient to answer the phone or listen to voicemail. With Voice to Text, users can simply read each transcribed message to determine if the call is urgent and requires immediate attention.

Save Time

Navigating voicemail menus and listening to voicemails in order is a thing of the past. Busy professionals don't have time to listen to every voicemail, and with Voice to Text, they can skip the voice messages they're not interested in reading and easily find messages they need.

Quickly Find Information

Users can efficiently hone in on specific transcribed messages to find exactly the information they need - from contact information to an address for their next meeting. With Voice to Text, users don't have to listen to every voicemail to capture specific information.

Prioritize Transcribed Messages

Voice to Text offers a practical, at-a-glance way to keep up with the messages that need attention. Users can quickly scan transcribed messages and address messages based on importance or time sensitivity.

Easily Accessible

Users can access transcribed voicemails via email, SMS, or the ClickConnex Mobile App (available for iOS and Android).
